

BONUS EXERCICES (1)

Bonus Exercise 1 : Building a Restaurant Menu App with Git and GitLab

Working individually, you are to create a simple restaurant menu application using HTML and CSS. The application should have at least two pages: an 'About Us' page and a 'Menu' page listing dishes and their prices. Use Git for version control and GitLab as your remote repository.

Bonus Exercise 2: Creating a Branch and Updating Styles

Continuing with the project from Exercise 1, create a new branch in your Git repository and make a change to the CSS file. Once you've completed this, commit the change and push the branch to your remote repository on GitLab.

Bonus Pair Up Exercise 3: Collaborative App Development with Git and GitLab

Pair up with a fellow developer, and together your task is to enhance the restaurant menu application that you created in Exercise 8. Work on separate parts of the application, and use Git for version control and GitLab as your remote repository.

Bonus Pair Up Exercise 4: Collaborative Feature Addition with Branches

Continuing with your partner from Exercise 10, your task is to add a new feature to your restaurant menu application. Each of you will make different feature additions on separate branches. Once done, you'll merge these branches into the `master` branch.
